Download our preprint here:

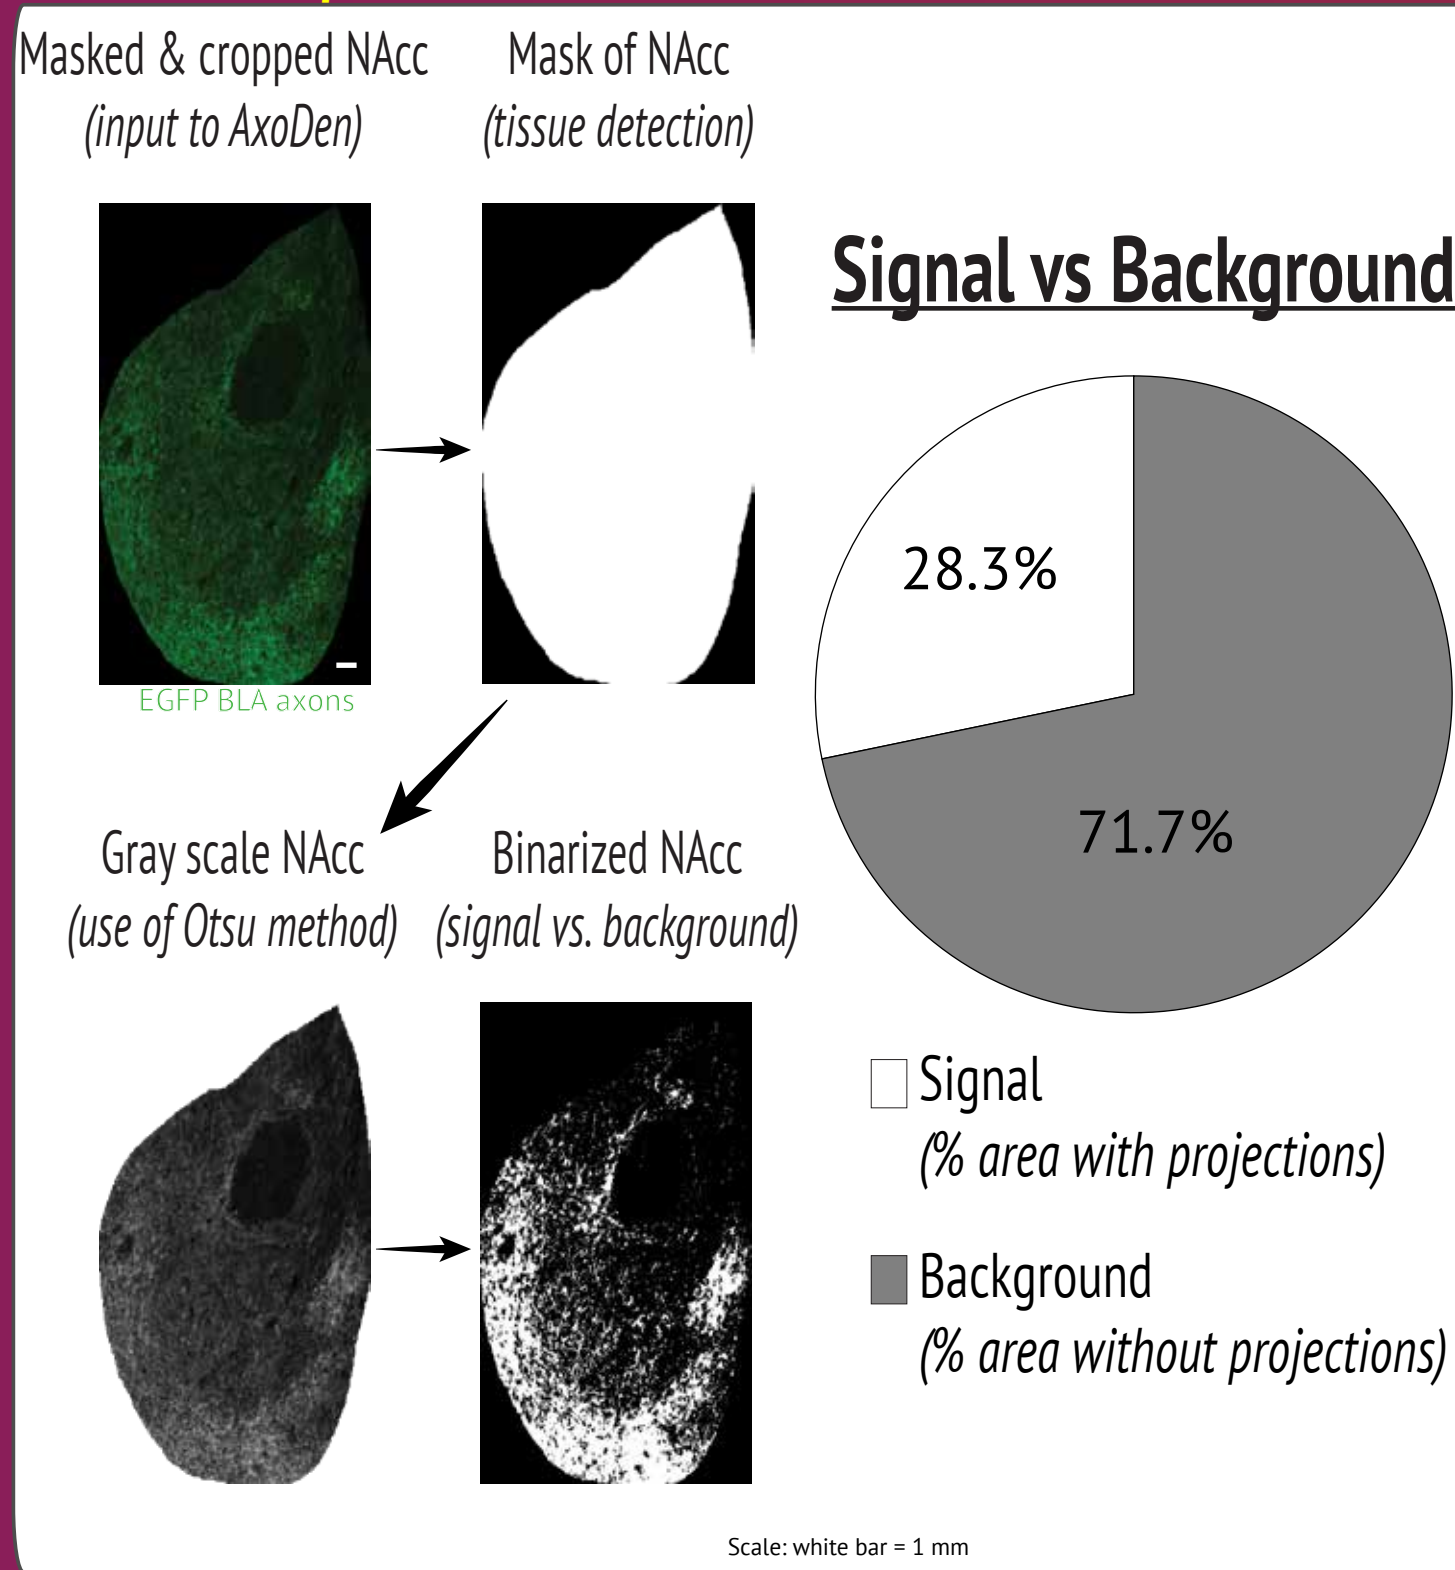

-1- Rationale

- Understanding how brain regions connect is crucial for neuroscience.
- Axonal innervation, a measure of axonal projection, is a key metric, but current methods for quantification result in variability or are costly.
- How can one develop a standardized protocol to quantify axonal projections, which are essential for understanding how the brain is wired? Here, we specifically look to quantify projections that are pain-active.
- AxoDen, a novel, open-source algorithm, that offers a standardized analysis.

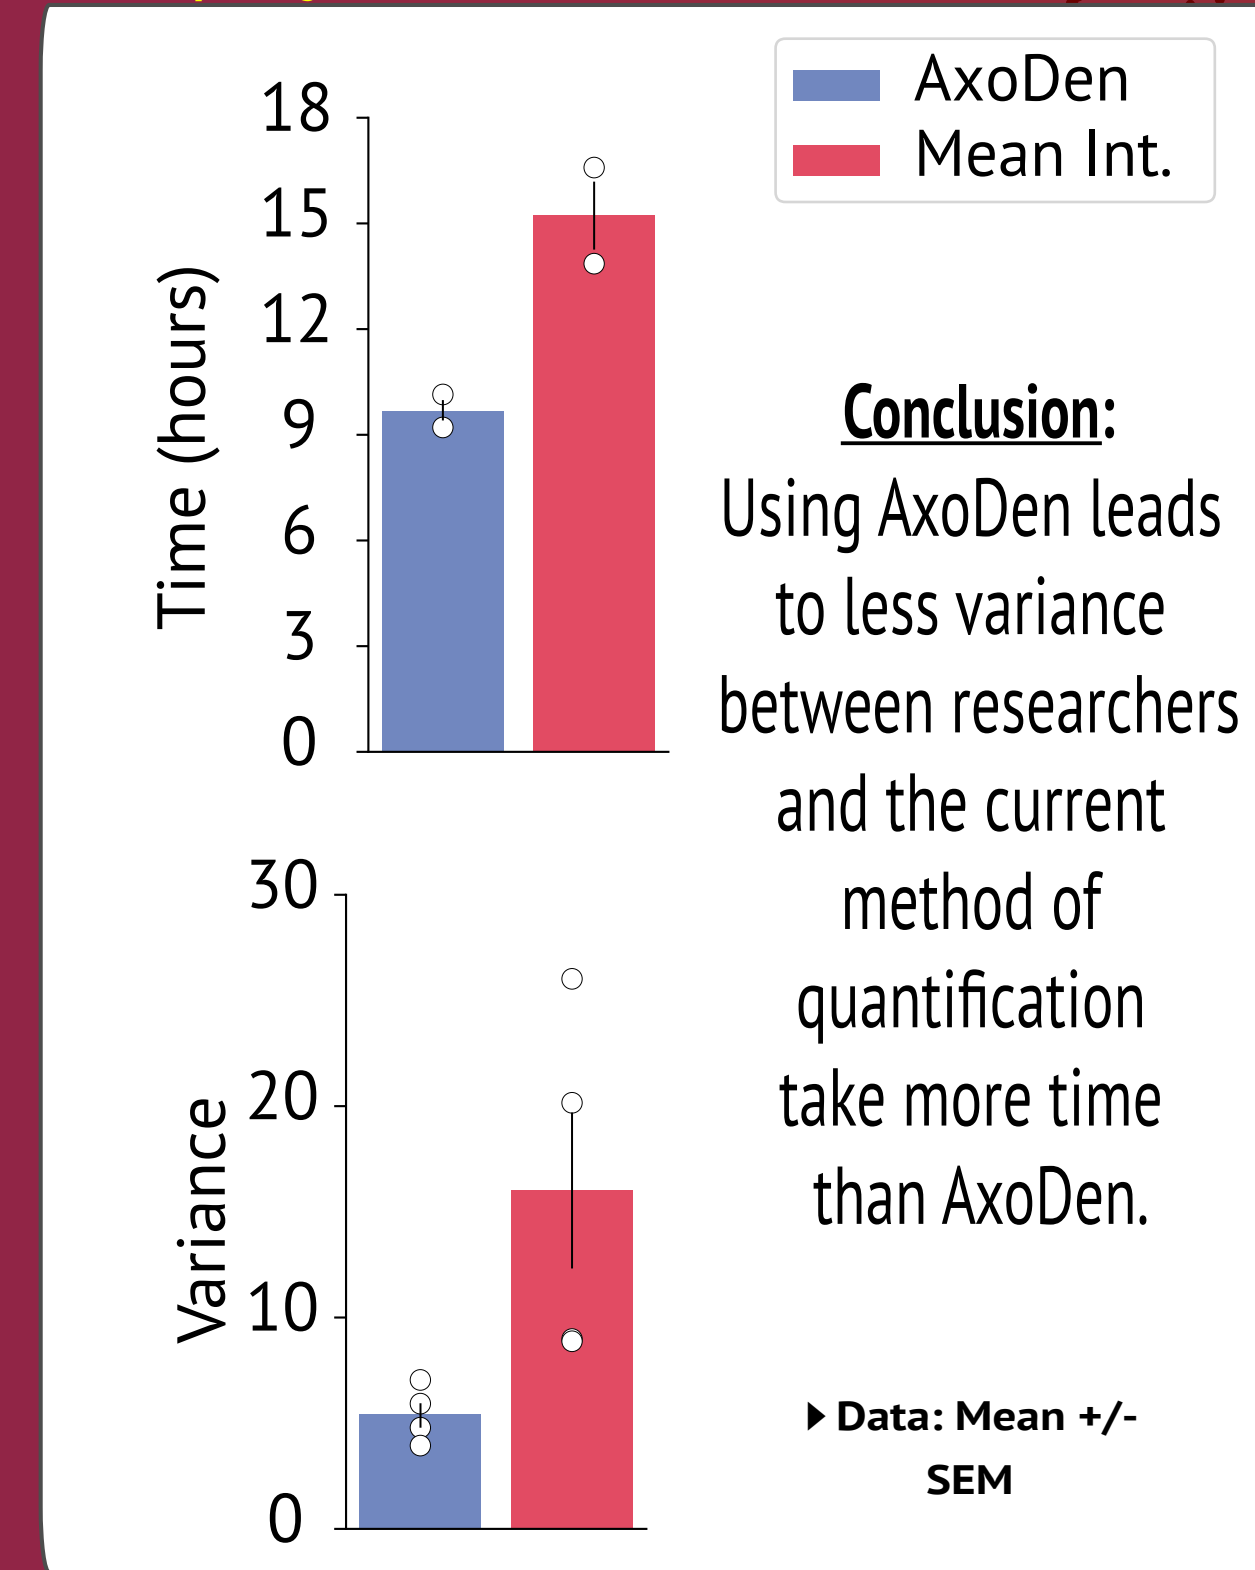

-2- Workflow

-3- Axoden Pipeline

-4- Comparing current methods to AxoDen

-7- Conclusions

- Axoden provides a large range of benefits:
 - Faster Analysis: Saves valuable research time.
 - Enhanced objectivity: Reduces inter-researcher variability.
 - Accurate Data: Delivers reliable measurements.
 - Accessibility: Freely available for all researchers. (<http://axoden.streamlit.app>)
 - Axoden empowers researchers to unlock new frontiers in brain connectivity mapping.

Streamlit

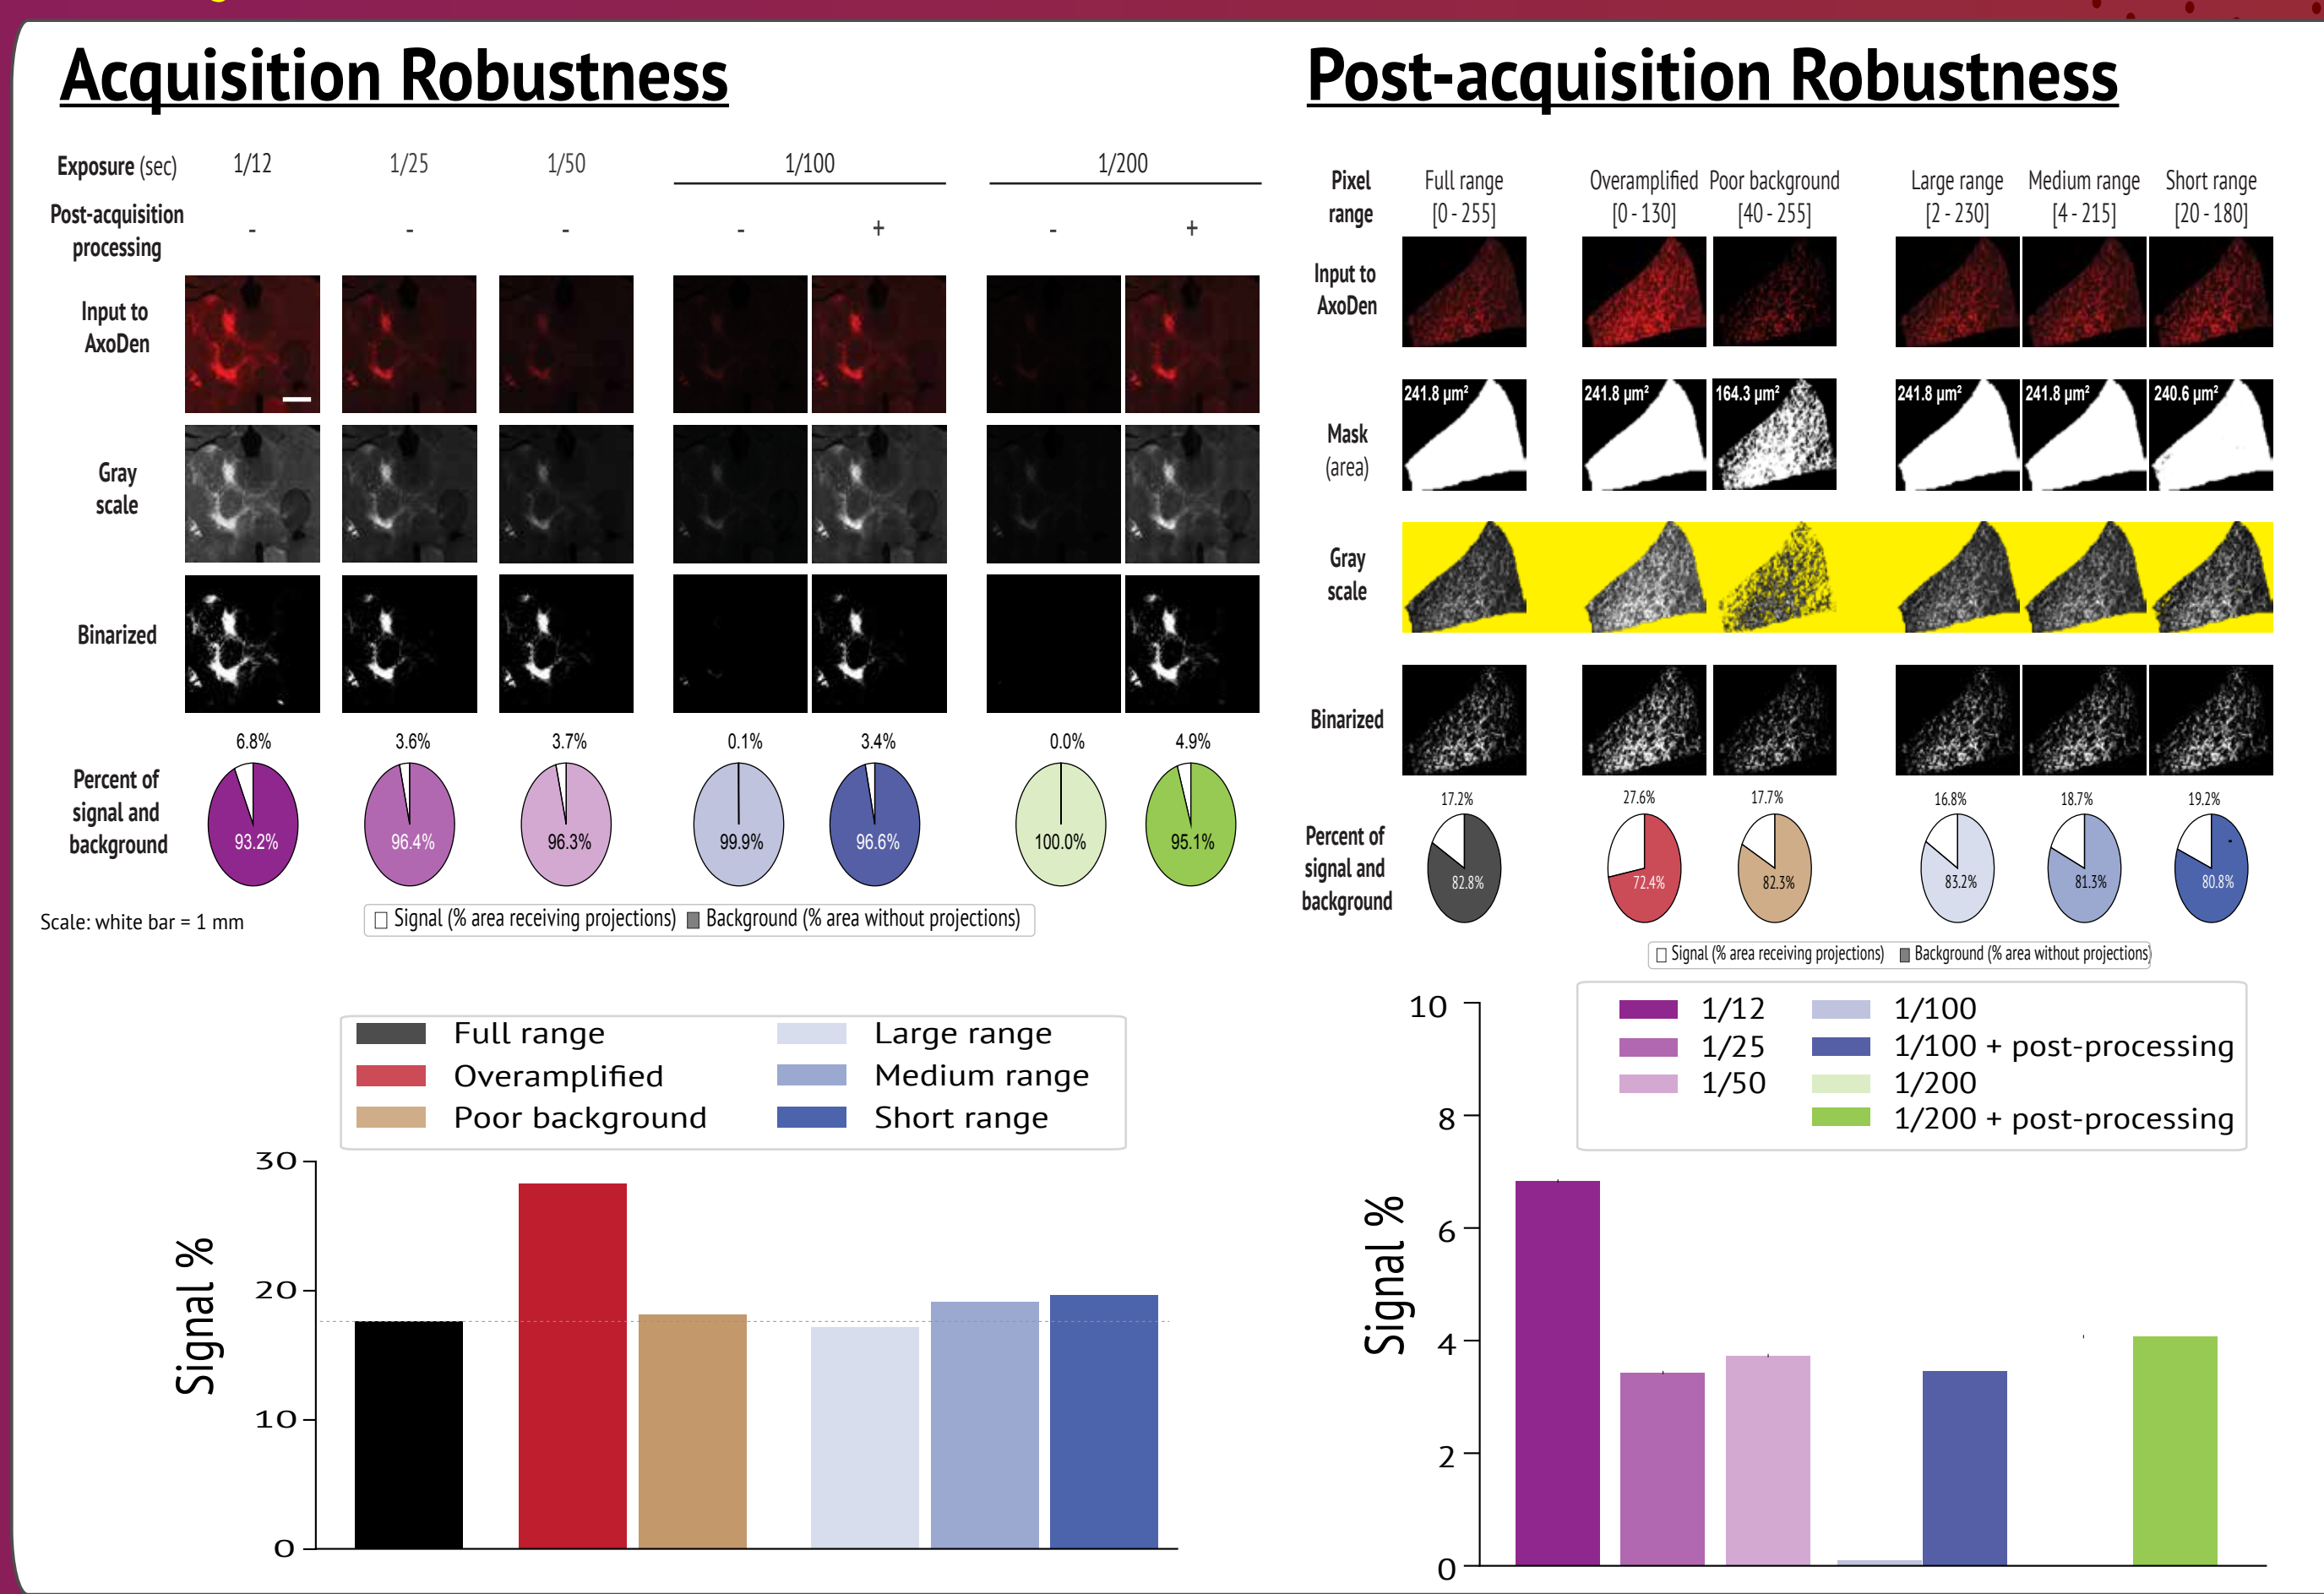

-8- Next Steps

- Publish the manuscript to eNeuro Journal.

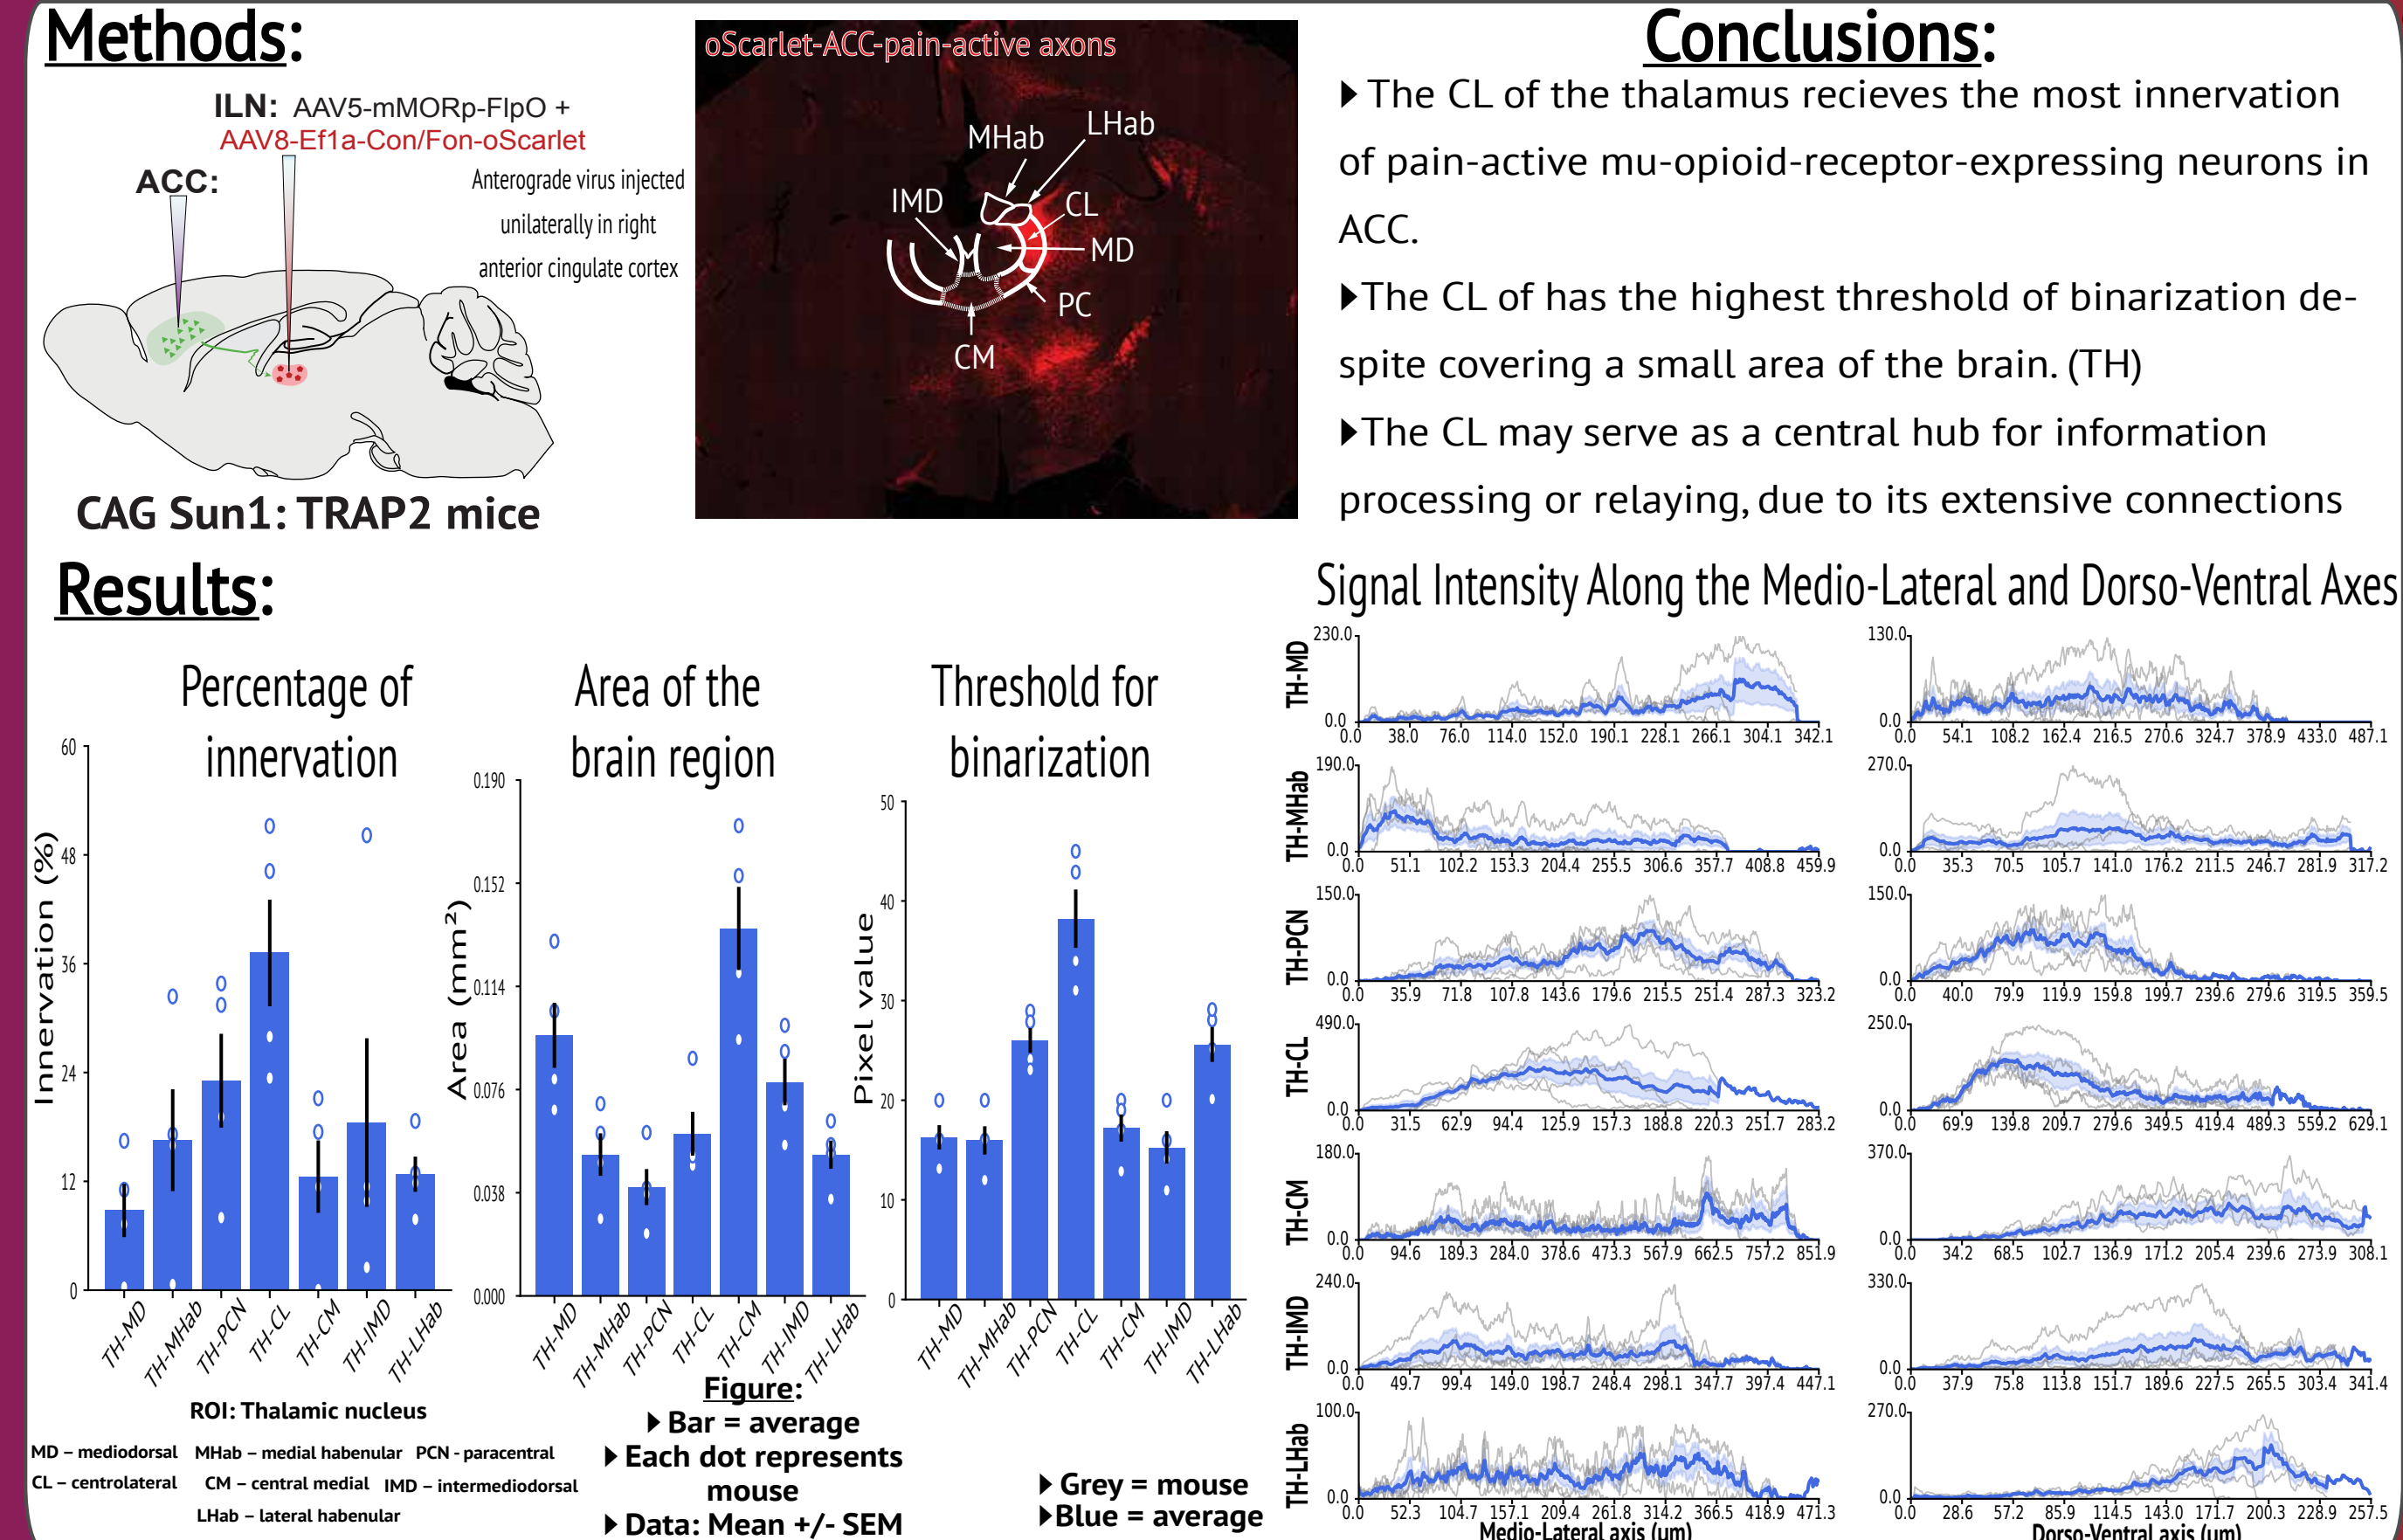

Access Github repository here:

-5- Testing the Robustness of AxoDen

-6- Testing AxoDen in the context of pain active neurons
